

2.7. **Short Answer #1:** I selected these cameras between the inner and the outer perimeter because they are right by the doors into the inner perimeter which is important to monitor. They are by the loading doors, employees entrance, and Showroom warehouse door.

Short Answer #2: Which two areas of the Veridian Dynamics facility are good candidates for video monitoring? Explain the reasoning behind your choice.

Two good candidates for video monitoring would be the loading dock area and the showroom to warehouse door. This is because the loading dock handles shipments which makes it a high risk area. And the showroom to warehouse door should be monitored to prevent unauthorized customers or employees from entering the warehouse.

Short Answer #3: Which access points are associated with the inner perimeter of the facility? Explain the reasoning behind your choice.

The access points associated with the inner perimeter are the showroom to warehouse door, employee entrance into the warehouse, and the loading dock doors. These are part of the inner perimeter because they provide access into area where only employees are allowed and where all inventory is kept (high risk).

Short Answer #4: Which access points are associated with the outer perimeter of the facility? Explain the reasoning behind your choice.

The access points associated with the outer perimeter are the main entrance, truck gate opening in the fence, employee parking entrance, and loading dock access from the freight yard. These belong to the outer perimeter because they are the first entry points from public areas into the facility property.

Short Answer #5: The access door between the showroom and the warehouse is considered part of which security perimeter? Explain the reasoning behind your choice.

The access door between the showroom and warehouse is part of the inner perimeter because it separates the showroom from the warehouse area where the valuable inventory is stored and needs to be secured.

Short Answer #6: Which access points are associated with the inner perimeter? Explain the reasoning behind your choice

The inner perimeter access points include the showroom-to-warehouse door, employee entrance, and loading dock doors. These areas lead into restricted warehouse areas and help protect valuable inventory.

Short Answer #7: In this exercise, which structure represents the interior security zone? Explain the reasoning behind your choice.

The warehouse represents the interior security zone because it contains the inventory, shipping operations, offices, and storage areas that require high protection.

Short Answer #8: : The showroom should be considered a part of which security layer in this scenario? Explain the reasoning behind your choice.

The showroom is part of the outer security layer because it is open to customers unlike the warehouse which is restricted to employees only.

Short Answer #9: Where would you place the DVR, switcher, and camera monitor and explain your choice? What type of storage would you use for keeping the camera feeds.

I would place the DVR, switcher, and camera monitor in a locked office inside the warehouse so only employees can access it and in an office so it has one more layer of security from the warehouse. I would use cloud storage to save the camera footage.

Short Answer #10: I really enjoyed this lab because it was very unique and different from typical assignments. It helped me think about physical security planning and understand how multiple security layers work together in a company. Figuring out perimeters, access points, and camera placements helped think about the physical security vs internal security.
